

Educator Guide

Ages 12-14 · 60 minutes · Groups of 2-3

Driving question

What does it take to bring an underwater meadow back to life?

Learning intention

Explore how seagrass restoration works and use what you discover to help someone else understand it.

Learning outcomes

Understand how restoration supports the recovery of seagrass meadows.

Investigate how the game represents restoration through changes, timescales and evidence of recovery.

Create an experience that uses choices, consequences and change over time to communicate an idea about ocean restoration.

Learning journey

What you need

Internet-connected display and student devices where possible; access to the Seagrass Stories webpage and game; one Learner Graphic Organiser per learner or group; 6-10 Post-its per group; pens or markers.

Facilitation approach

Learners encounter the subject, investigate it through play, reflect on what they discover and apply their understanding through creation. Facilitation focuses on curiosity, questions, connections and evidence of learning.

Before you begin

The restoration mats support seagrass shoots so they can stay in place, take root and grow. The game represents parts of the restoration process. Encourage learners to explore what changes, what takes time and what evidence could indicate recovery.

Use the Learner Graphic Organiser throughout the session to make thinking visible. Learners can write, sketch, connect ideas and return to earlier thinking as their understanding develops.

Experience → Investigate → Reflect → Create

EXPERIENCE 15 min	Watch, observe the meadow, meet Nada and capture initial thinking using See · Think · Wonder .	SEE What do you notice? THINK What do you think is happening? What relationships can you see? WONDER What questions does this raise? What do you want to understand more about?	Learners notice details and relationships, offer interpretations and generate questions they can investigate.
INVESTIGATE 15 min	Play Seagrass Stories through the lens of a scientist and examine change, timescale and recovery.	What changes quickly? What might take longer in the ocean? What evidence would tell you the meadow is recovering?	Learners distinguish between immediate game responses and ecological change, and identify possible evidence of recovery.
REFLECT 15 min	Pause individually, then share and compare thinking with others. Return to earlier See · Think · Wonder notes where useful.	What changed how you think about ocean restoration? What are you still wondering?	Learners articulate a shift, connection or new understanding and identify questions that remain.
CREATE 15 min	In groups of 2-3, use 6-10 Post-its to design an experience that helps someone else understand an idea about ocean restoration.	What choice or action happens? What happens because of it? How does the habitat respond? How do things change over time?	Learners communicate understanding through a causal chain: Choice / Action → Consequence → Habitat Response → Change Over Time .

See · Think · Wonder

Use this thinking routine during the Experience stage to move from observation to interpretation to inquiry. Give learners time to notice before inviting explanations. Capture different interpretations and questions, then revisit them later in the session.

The 6-10 Post-it constraint

The constraint gives learners enough elements to explore relationships and consequences while keeping the system workable. Ask groups to connect the Post-its with arrows and explain: **What happens because of what?**

After the session

Capture where curiosity appeared, which connections learners made, what their creations revealed about understanding, and where the experience could be strengthened.

From Curiosity to Creation

Use this organiser to capture what you notice, think, question and discover as you move through the learning experience.

EXPERIENCE

SEE

What do you notice?

Look closely at the meadow. Capture details, changes, living things and anything that catches your attention.

EXPERIENCE

THINK

What do you think is happening?

What relationships can you see between the plants, animals and habitat? What might explain what you notice?

EXPERIENCE

WONDER

What questions does this raise?

What do you want to understand more about?

INVESTIGATE · LOOK BEHIND THE GAME

Play through the lens of a scientist.

What changes quickly?

What might take longer in the ocean?

What evidence would tell you the meadow is recovering?

REFLECT · WHAT DID YOU DISCOVER?

Pause and compare your thinking.

Something that changed how I think about ocean restoration:

Something I am still wondering:

CREATE · BRING IDEAS TO LIFE

Put your understanding to work.

In groups of 2-3, use 6-10 Post-its to design an experience that helps someone else understand something you discovered about ocean restoration.

CHOICE / ACTION
What does someone do?

→

CONSEQUENCE
What happens because of it?

→

HABITAT RESPONSE
How does the meadow respond?

→

CHANGE OVER TIME
What happens next?

Connect your Post-its with arrows. What happens because of what?
